

# 16 bit binary pulse width modulation

## PWM

FX5S

FX5UJ

FX5U

FX5UC

This instruction outputs the pulse (in 16-bit data units) of the ON time (in 16-bit data units) specified by (s1) and the period specified by (s2) to the output destination specified by (d).

## Setting data

### ■Descriptions, ranges, and data types

Operand	Description	Range	Data type	Data type (label)
(s1)	ON time or the device number storing the ON time	1 to 65535	16-bit unsigned binary	ANY16
(s2)	Period or the device number storing the period	1 to 65535	16-bit unsigned binary	ANY16
(d)	Channel number or device number from which pulses are to be output	—	Bit/16-bit unsigned binary	ANY_ELEMENTARY*1
EN	Execution condition	—	Bit	BOOL
ENO	Execution result	—	Bit	BOOL

\*1 Digit specified bit type label cannot be used.

### ■Applicable devices

Operand	Bit	Word			Double word		Indirect specification	Constant			Others
	X, Y, M, L, SM, F, B, SB, S	T, ST, C, D, W, SD, SW, R	U□\G□	Z	LC	LZ		K, H	E	\$	
(s1)	○	○	○	○	—	—	○	○	—	—	—
(s2)	○	○	○	○	—	—	○	○	—	—	—
(d)	○*1	○*2	○*2	○*2	—	—	○	○*2	—	—	—

\*1 Only Y can be used for a bit device.

When a bit device is specified, specify one of Y0 to Y7. The high-speed pulse input/output module bit device (Y) cannot be specified. If Y is specified, outputs are enabled when there is an unused channel number in the parameter setting and the specified Y number is not used.

The nibble of a bit device cannot be specified.

\*2 When a word device or constant is specified, specify one of the channel numbers.

Specify K1 to K4 (axis 1 to 4) for the CPU module, and K5 to K12 (axis 5 to 12) for the high-speed pulse input/output module.

## Processing details

- This instruction outputs the pulse of the ON time specified by (s1) and the period specified by (s2) to the output destination specified by (d).

- Time with a unit selected on the parameter setting screen ( $\mu$ s or ms) can be specified by (s1) and (s2).
- The pulse output destination channel number selected on the parameter setting screen can be specified by (d).
- This instruction store the number of pulses, pulse width, and period output from each channel to an SD device. The pulse width and period are stored in the units set by the parameters. When 0 is specified in the pulse output, pulses are output without any limitation.

Pulse output destination channel	Number of output pulses	R/W	Initial value	Timing of reflection on operation	Timing of clearing to initial value

\*1 When the DHCMOV instruction is used, the latest value can be read. A writable device can be updated immediately.

\*2 Parameter setting values are set to an SD device at STOP to RUN.

\*3 When this instruction is executed, the pulse width and period specified (s1) and (s2) are set to an SD device.

• After the pulse output is started from each channel, the pulse output monitor turns on.

Pulse output destination channel	Pulse output monitor	R/W	Initial value	ON timing	OFF timing

CH2	SD5323, SD5322				
CH3	SD5339, SD5338				
CH4	SD5355, SD5354				

- The number of output pulses set to an SD device is valid for this instruction as well. The setting values are always read and updated.
- When the specified number of output pulses is equal to or less than the number of pulses which have already been output, pulse output stops after outputting pulses which are being output.
- When the specified number of output pulses is larger than the number of pulses which have already been output, pulse output stops after outputting set number of pulses.
- When the number of output pulses is set from the no limitation output setting (number of output pulses is 0), the number of output pulses is not updated (because outputting pulses continues or stops in the no limitation output).
- The maximum number of output pulses which can be output when the PWM instruction is executed once (= maximum value which can be set to an SD device) is "2147483647".
- The ON time and period can be set during the pulse output. Setting values are always read and updated.
- When the number of output pulses is 0 (no limitation output setting), the monitor of the current number of output pulses is set to 0.

- When the number of output pulses is specified, the output pulses are monitored. When the PWM output is executed several times, the monitor of the number of output pulses is an integrated value.
- The monitor of the current number of output pulses can be changed during the pulse output.
- The monitor of the current number of output pulses is updated when the number of pulses is counted at the falling edge of pulses in the positive logic and at the rising edge of pulses in the negative logic.
- When the output always remains ON or OFF, the monitor of the current number of output pulses does not change.
- The maximum value of the monitor of the current number of output pulses is "FFFFFFFFH". After the current number of output pulses reaches the maximum value, the monitor of the current number of output pulses starts to count again from "0".

## Precautions

- Specify the ON time by (s1) and the period by (s2) so that [(s2)-(s1)] is equal to or larger than 3  $\mu$ s.
- Specify the ON time by (s1) and the period by (s2) so that they are equal or larger than the following values.

[FX5S/FX5UJ CPU module]

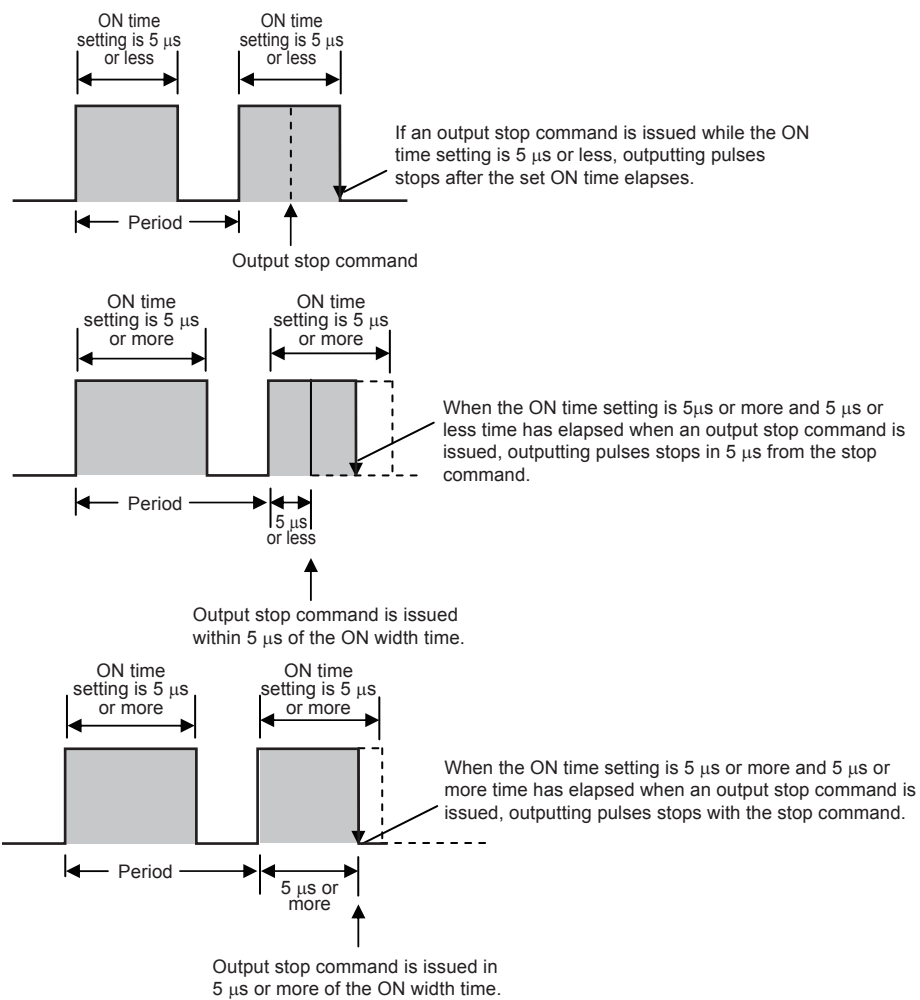

Output number	(s1) ON time	(s2) Period
<b>CPU module</b>		
Y0 to Y2	2 $\mu$ s more	5 $\mu$ s more
Y3 to Y7	200 $\mu$ s more	400 $\mu$ s more

[FX5U/FX5UC CPU module and high-speed pulse input/output module]

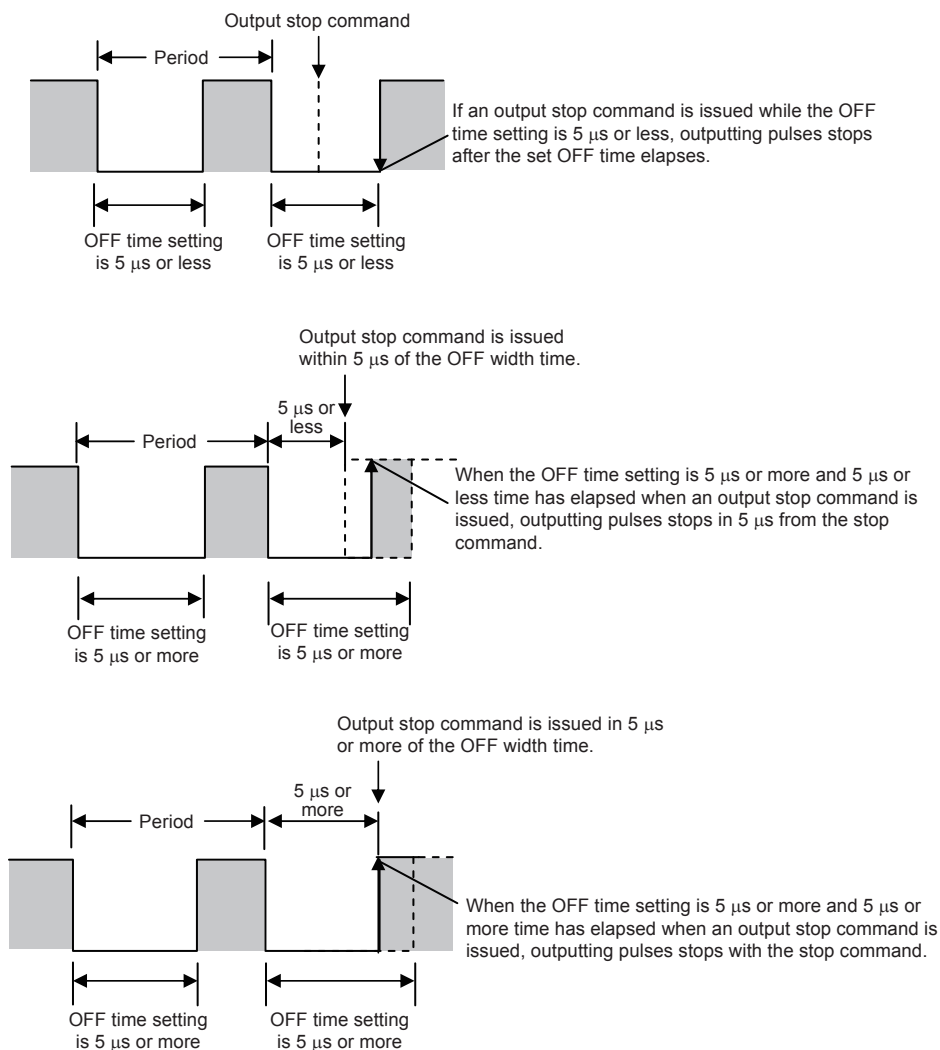

Output number		(s1) ON time	(s2) Period
<b>CPU module</b>	<b>High-speed pulse input/output module</b>		
Y0 to Y3	Y0 to Y2	2 $\mu$ s more	5 $\mu$ s more
Y4 to Y7	—	200 $\mu$ s more	400 $\mu$ s more

- When a channel number that is not selected for the PWM output in the parameter setting is specified for (d), this instruction is not executed. An operation error occurs.
- Do not specify the channel numbers of the high-speed pulse input/output module (5 to 12) in a program with interrupt priority set to "1".

- Operations when the PWM output is stopped (while the output pulse is on)

- Operations when the PWM output is stopped (while the output pulse is off)

- The PWM output stops when SM8034 is on, and starts when SM8034 is off.
- PWM output does not stop, even if a pulse stop command for positioning is driven.
- When specifying the number of output pulses, executing the PWM instruction, and then outputting pulses again after the pulse output stops due to the completion of output of the specified number of pulses, turn OFF the contact which drove the PWM instruction. When driving PWM output by the HIOEN instruction, use the HIOEN instruction to turn PWM output off.
- When the period setting is equivalent to the ON time setting, the output always remains ON. The output ON state continues even after "Period x Number of output pulses" is finished in this condition.

## Program example

When the contents of D10 are changed ranging from "0" to "50" in the program example shown below, the average output from Y0 will be ranging from 0 to 100%.

An error will occur if the contents of D10 exceed K50.

## Operation error

Error code (SD0/SD8067)	Description
1810H	The output destination specified by (d) is already used by another instruction (positioning instruction). (The PWM output is not executed.)
	A Y device is specified as the output destination specified by (d), and there is no unused channel number in the parameter setting.
2221H	The parameter set value is out of range.
3405H	Y10 or later is specified as the output destination specified by (d). (The PWM output stops.)
3580H	An instruction that cannot be used in an interrupt program is used
3600H	A channel number that is not selected in the parameter setting are specified for the output destination specified by (d). (The PWM output is not executed.)
3611H(CH1)	<p>The ON time specified by (s1) is larger than the period specified by (s2). (The PWM output stops.)</p> <p>Values of an SD device for setting pulse width and period of this instruction are incorrect. (The PWM output stops.)</p> <p>The ON time or period is less than "1".</p> <p>The SD device specified for the number of output pulses stores a value outside the available range (0 to 2147483647).</p>
